

Process TestLab – The first lab that lets you test your business processes before implementation.

Minimize risk. Increase performance. Reduce costs.

The sheer number and complexity of factors which determine process quality limit the ability for manual testing. Many quality and performance problems come to light only after processes have been implemented.

The Process TestLab provides a unique safeguard: validation, quality assurance, analysis, simulation and stresstests.

Identify and assess problems before they surface in your daily business.

Quality is the hallmark of successful business processes. Dynamic markets offer as many opportunities as they offer challenges to get it right first time.

The right process design becomes a quality process design only when it's complete, workable and when it allows you to achieve your process and business objectives.

But how will the IT implementation of your process change your assumptions? How will changes to the design impact the outcome? What if circumstances change – will your process still be the right one and deliver to your expectations?

These are the issues which determine real process quality and they require detailed knowledge about the processes you will be running and managing.

The taraneon Process TestLab is the first lab environment for testing, analysing and assessing process quality and performance prior, during and after process implementation. The Process TestLab offers reliable test and evaluation procedures for all phases for your process development and management lifecycle, helping you minimize risk, reduce design and implementation effort and increase reliability and quality of your processes during the operations phase.

Analysis, risk reduction and increased process reliability: quick and easy with the Process TestLab

Changes to business processes can be risky: Independent analysis shows that only 18% of re-engineering-projects reach their objectives. The Process TestLab provides a proven and reliable service to help you secure your process objectives.

Ensure real process design quality

The Process TestLab provides a range of tests designed specifically to help you analyse and ensure the quality of your process designs:

- Tests to check the process logic
- Methods to validate business functionality
- Pre-checks during hand-over from business to IT

Make informed decisions about your processes

Need to compare alternative process solutions? Unsure how a particular decision will really impact a process? The Process TestLab can help you by running your processes with different scenarios under controlled lab conditions – letting you know how your decisions will impact process performance - even before you have started to implement your processes.

Stresstest your processes

How stress-resistant are your processes, what are their risk factors and what are the limitations under which they can still provide acceptable performance results? The Process TestLab can provide answers to these questions before reality does it for you.

Make these benefits yours:

The taraneon TestLab offers a unique and independent lab environment to test, evaluate and analyse your business processes even before you have implemented them. We offer a range of tests and assessments to validate and measure process quality in all phases of the process lifecycle.

- Identify process risks during design
- Lower project costs during design and implementation
- Avoid time and budget consuming error handling
- Evaluate change impact on processes
- Improve the quality of your process design
- Identify performance risks using stresstest analysis
- Validate conformity with compliance and governance

Let the Process TestLab show you what you can expect from your processes.

The more you know about your processes, the more reliable and successful your business decisions will be.

Make the Process TestLab part of your strategy for success.
